

HTML Basics Analysis

HTML is used to create websites and display content such as text, images, and other elements in a web browser.

Block elements take up the full width available and appear one below another. Inline elements only take up as much width as necessary and appear in the same line.

The `<form>` tag is used to collect user input such as names, passwords, and other data, which can then be submitted to a server.

The `<div>` tag is used to create larger sections or containers in a webpage, while `<span>` is used for smaller portions of text within a line.

Semantic elements are HTML tags that provide meaning to the content they enclose, such as `<header>`, `<footer>`, `<article>`, and `<section>`.
